

The background of the top half of the page is a photograph of a person in a light-colored shirt working on a laptop. Their hands are visible, with one hand holding a pen and the other on the keyboard. A semi-transparent bar chart with vertical bars of varying heights is overlaid on the right side of the image. On the left side, there are several overlapping circles and a vertical line with dots, resembling a network or data visualization. The overall lighting is warm and slightly blurred.

## 1 Introduction

### 1.1 Document Purpose

The purpose of this document is to define the Central Switching Service (CSS) Interfaces at a technical level to enable all the participants, Central Data Services/Market Participants, to update their current systems to meet the new requirements.

It is not a standalone document and does not describe the full functionality of the CSS. It should be read in conjunction with the requirement specifications published on the Ofgem website:

<https://www.ofgem.gov.uk/publications-and-updates/css-design-and-delivery-products>

CSS provides application interfaces for the following Market Roles:

- Suppliers
- Data Enquiry Service (DES)
- Shippers
- Electricity Retail Data Agent (ERDA)
- Gas Retail Data Agent (GRDA)
- Electricity Central Online Enquiry Service (ECOES)
- DCC Smart Metering (DCC SM)
- Data Collectors (DC)
- Data Aggregators (DA)
- Meter Asset Providers (MAPs)
- Metering Equipment Manager (MEMs)
- Electricity Domain Data Governance (EDDG)
- Gas Domain Data Governance (GDDG)
- Retail Energy Code Domain Data Governance (RECDDG)
- Smart Metering Enduring Change of Supplier (ECOS)
- *Smart Meter Data Retrieval (MDR) \*Not effective until June 2024*

## 1.2 Document Considerations

This document is based on the Logical Abacus model version 4, 5 and 6 and D-4.2.1 CSS User Requirements Specification version V2.2.

### 1.3 Out of scope

This document does not cover the following information, which will be in other policy documents to be generated by the SI and DCC, although some of its content may contribute to those documents.

LIG is not the owner of these documents.

- Code of Connection (COCO)
- Data dictionary
- Business rules
- Procedures for the use of CSS – This includes items like the retry on error policy, raising errors to the service desk, etc

### 1.4 CSS Functionality

The CSS is responsible for the following:

- Mastering the Registrations
- Mastering the Retail Energy Location (REL)
- Distribution of Registerable Measurement Point (RMP)

## 1.5 Implementation Overview

The CSS will be a cloud-based service hosted on the Microsoft Azure Platform. All interaction with the CSS will be real-time messaging, based on a predefined JavaScript Object Notation (JSON<sup>1</sup>) format (See sections 5 and 6).

Inbound messages will be sent by calling pre-determined URLs whilst the outbound messages are delivered to URLs of the recipient's choice. These services are explained in technical detail in the Transport layer and general principles section of this document.

The diagram below depicts the interaction with the CSS from the perspective of sending messages into CSS and receiving messages from CSS.

CSS advertises multiple endpoints for receiving messages each of which fulfils a specific business function, for example, a specific endpoint is used to receive switch requests. Multiple external systems with the same business needs will deliver messages to the same endpoint, for example, all switch requests are sent to the same endpoint regardless of which participant instigated the request.

To receive messages from CSS, a recipient registers target endpoints for each market participant role they hold and all outgoing messages applicable to that role are sent to these endpoints by CSS.

<sup>1</sup> Pronounced Jason, as in "Jason and the Argonauts"

## 1.6 AddressBase® Premium

The Registration and Addressing elements of the CSS will make use of Ordnance Survey AddressBase® Premium (ABP) data (<https://www.ordnancesurvey.co.uk/business-and-government/products/addressbase-premium.html>).

The data passed across the interfaces may only be used for the permitted purpose under the licence with Ordnance Survey. The permitted purpose as defined in the agreement is for the “purposes of enabling switching including (without limitation) for the purposes of design, development, testing, integration and live operational use.”

The field mappings contained within this document are taken from v2.5 of the ABP technical specification, which can be found here:  
<https://www.ordnancesurvey.co.uk/documents/product-support/tech-spec/addressbase-premium-technical-specification.pdf>

## 2 Connectivity and security

The CSS solution will be built and operated from the Azure Public Cloud.

The network connectivity design is detailed in the code of connection document (COCO), which accompanies the Interface specification. This should be used to determine how to connect with CSS.

## 3 Transport layer and general principles

This section describes the transport layer and general principles of the CSS Service.

### 3.1 OpenAPI Specification

Access to the underlying CSS services will be controlled via REST API's fronted by Azure API Management.

The CSS will be using Open API specification version 3.

<https://github.com/OAI/OpenAPI-Specification/blob/master/versions/3.0.0.md>.

#### 3.1.1 Versioning

When the system has gone live, new functionality may be required or bugs may be found. These changes will be submitted to the Retail Energy Code Company (RECCo) and may result in changes being made to the CSS. In order to rollout those changes, it may be necessary to issue a new version of the API.

New versions can be as a result of changes to the API itself, or more likely to underlying business logic directly referred to by the API. This can be problematic when determining breaking changes as the business logic will be distributed across multiple consumers.

New versions will only be issued if the result of a change is deemed to be a breaking change, non-breaking changes will be issued as revisions to the existing version.

A Market Participant can opt into new version changes when the Market Participant is ready. When every Market Participant is consuming the new version, the old version will be deprecated. There will be a time constraint on this, and each Market Participant will be notified when this happens.

##### 3.1.1.1 Breaking Changes

As the very nature of HTTP API's cross application boundaries, trying to determine what defines a breaking change can be complicated as client code can dictate what is deemed breaking.

In general, we can state that the following will cause a breaking change:

- Addition and removal of mission critical properties to the schema model, for example, new properties critical to the business process to ensure data integrity.
- Removal of API endpoints (still being consumed).
- Changing schema model properties (optional, max length, datatype etc) for existing properties.
- New domain values. For example, adding a new Status type. In general, this would be deemed a breaking change as consumers will not be expecting this.

##### 3.1.1.2 Non-Breaking Changes

To aid Market Participants to get a first look at changes to an API, revisions will be used. Revisions enable us to independently release developer previews of upcoming changes. This will help determine if those changes could be deemed as breaking changes, if so, a new version would be created with those changes.

In general, we can state that the following will not cause a breaking change:

- Addition of new noncritical properties to the schema model. **Market Participants should ignore properties on the model which they have not implemented, this will ensure that new properties will not break existing logic.**
- New endpoints added to API's

Versioning of the API's will be handled on the API route, i.e. <CSS URL>/< CSS API Route>/< CSS API Version>/< CSS Operation Route>.

Please see below for examples:

*<https://centralswitchingservice.com/dccsm/v1.0/rmps/electricity>*  
*<https://centralswitchingservice.com/dccsm/v1.0/rmps/gas>*  
*<https://centralswitchingservice.com/supplier/v1.0/registrations>*  
*<https://centralswitchingservice.com/supplier/v1.0/registrations/switch>*  
*<https://centralswitchingservice.com/supplier/v1.0/errors>*

Participants can find information on product specific API routes on the CSS Developer Portal.

Different versions of the API will be available independently in the developer portal and a change log will document any changes made to the new version.

### 3.1.2 Developer Portal

All versions and revisions of the API's will be documented in the CSS developer portal as OpenAPI Specification Version 3.

The body of the messages described in sections 5 and 6 are provided to give an indication of what will be available when development begins. The open API specification in the portal is the documentation that should be used by developers.

This will be available during the DBT phase, and for the life of the CSS and can be found here:

<https://devportal.centralswitchingservice.co.uk/>

## 3.2 Further Reading

### 3.2.1 What is REST?

Representational state transfer.

*"Representational State Transfer (REST) is a software architectural style that defines a set of constraints to be used for creating Web services. Web services that conform to the REST architectural style, termed RESTful Web services (RWS), provide interoperability between computer systems on the Internet."*

Source: [https://en.wikipedia.org/wiki/Representational\\_state\\_transfer](https://en.wikipedia.org/wiki/Representational_state_transfer)

### 3.2.2 OpenAPI Specification

V2 was known as Swagger, V3 is now Open API Specification.

*"The OpenAPI Specification, originally known as the Swagger Specification, is a specification for machine-readable interface files for describing, producing, consuming, and visualizing RESTful web services. Originally part of the Swagger framework, it became a separate project in 2016, overseen by the OpenAPI Initiative, an open source collaborative project of the Linux Foundation. Swagger and some other tools can generate code, documentation and test cases given an interface file."*

Source: [https://en.wikipedia.org/wiki/OpenAPI\\_Specification](https://en.wikipedia.org/wiki/OpenAPI_Specification)

### 3.2.3 OpenAPI Initiative

*"The OpenAPI Initiative (OAI) was created by a consortium of forward-looking industry experts who recognize the immense value of standardizing on how REST APIs are described. As an open governance structure under the Linux Foundation, the OAI is focused on creating, evolving and promoting a vendor neutral description format."*

*APIs form the connecting glue between modern applications. Nearly every application uses APIs to connect with corporate data sources, third party data services or other applications. Creating an open description format for API services that is vendor neutral, portable and open is critical to accelerating the vision of a truly connected world."*

Source: <https://www.openapis.org/about>

### 3.3 Generic Asynchronous Message Flow

The diagram below depicts a generic message flow sequence applicable to both the CSS and interfacing systems. The exception being the CSS Broadcast message shown represents a CSS specific post-processing step, to illustrate how the CSS will inform market participants.

The key process steps are:

- 1. Send Message**  
This involves posting a message to a predefined endpoint (URL).
- 2. Accept Message**  
On Receipt of the message a synchronous response is sent to the sender accepting the message (202).
- 3. Reject Message**  
A message is rejected based on schema validation (structure/type/content). The sender remains responsible for resolving the rejected request.
- 4. Process Message**  
The receiver has accepted the message and performs their internal processing of the message content. If this is successful there is no requirement to inform the sender.
- 5. Send Error Message**  
If the internal processing of the message content fails for reasons directly related to the message itself the sender is informed by sending an error message. This message is sent asynchronously.
- 6. Message Generation (CSS specific)**  
This is an illustrative CSS specific post processing step to show how CSS will broadcast information messages to subscribers in response to an incoming message. Other systems may have alternative post processing steps at this point.

### 3.4 Webhooks

#### 3.4.1 What they are

As more and more of what we do with connected apps can be described by events, Webhooks are becoming very popular as a mechanism to react to these events in a resource light decoupled way.

A Webhook (also called a web callback or HTTP push API) is a way for an application or system to provide other applications or systems with real-time information. It delivers data to other applications as it happens, meaning you get data immediately, as opposed to typical APIs where you would need to poll for data very frequently (hammer polling) in order to get it real-time. This makes Webhooks much more efficient for both providers and consumers.

Market participants will need to create an application or system capable of receiving and responding to HTTP requests. CSS will make a HTTP request to your application or system, these will be a POST requests to your Webhook URLs with a JSON body, it is then up to you to process the request and its content.

The data sent to and from CSS is an object in JSON, which is an unordered set of name/value pairs so may not come through in a logical order, examples of data in this document are for information only and do not infer the actual order of receipt.

#### 3.4.2 Why do we need them?

The "messaging" functionality within the CSS is based on **real-time events**, that is, events get triggered by some action within CSS, and these events are then **pushed** out to **subscribers** of those events.

Webhooks give a way for the CSS to push messages out to the various Market Participants who are subscribed to those events in a reactive real-time manner, which makes the system highly performant and scalable.

#### 3.4.3 Subscribing

There will be a way for a market participant to request a CSS registration. They will need to provide at least their Market Participant Id, their role and company name. Their request will be validated, making sure that they are eligible to be given access to the system. Then a subscription key will be issued to the Market Participant. The key will also be stored within CSS.

Once the Market Participant has the subscription key and their Webhooks available, they then need to post to the CSS API as detailed in section 5.4.

Please refer to section 5.4 for the webhook API.

#### 3.4.4 Messages

Once subscribed to the CSS, the market participant will only receive the messages they have subscribed to. They will not receive every possible message sent by CSS. The messages sent out per context type are defined in section 6.2.

#### 3.4.5 Securing

Each Market Participant implementing Webhooks has a need to ensure that requests it receives are from trusted parties i.e. the CSS.

When registering, Market Participants can optionally send an x-api-key http header (normally a UUID generated by themselves), this x-api-key http header will be sent back by CSS on all requests to the Market Participants registered Webhook as the same x-api-key http header. This key can be updated by the Market Participant at any time, by re-registering the Webhook with a new x-api-key. This is over and above the security which will be in place as documented in the code of connection document (CoCo).

The x-api-key is optional, it is an additional means for Market Participants to ensure that messages came from CSS and for them to be in control of the keys and when they need to rotate them, it can be useful in early development to connect to an API before network security is in place. Best practice would be to have two keys (Primary and Secondary) you would check both against the x-api-key sent in the header. So, let's say the Primary key is registered against your webhook, when you need to rotate the Primary key, register the Secondary key against your webhook, then change the Primary key to a new value, rinse and repeat when rotating the Secondary key.

### 3.4.6 Delivery and Throttling

CSS is hosted on Azure as an Integration Platform As A Service (IPAAS) in a serverless environment, which allows, in theory, infinite scale out where resources "spin" up and down according to demand.

Event delivery will be via Azure Event Grid. If Event Grid cannot confirm that an event has been received successfully by the subscriber's Webhook, it tries to redeliver the event for a certain amount of time (24 hours by default) using a back off/retry mechanism. After that time is breached, Event Grid will move that event to a "Dead Letter" queue, which will be processed independently by CSS depending on the failure. For more information, see [Event Grid message delivery and retry](#).

To ensure that the CSS does not flood the individual Market Participants with a high volume of events in the cases where the Market Participant Webhook may have been offline (planned maintenance, in a faulted state etc). Market Participants can return a 429 or 503 status code with a **Retry-After** header, CSS will queue event delivery until that point.

The **Retry-After** response HTTP header indicates how long the user agent should wait before making a follow-up request. The two main use cases supported are:

- When sent with a [503](#) (Service Unavailable) response, this indicates how long the service is expected to be unavailable.
- When sent with a [429](#) (Too Many Requests) response, this indicates how long to wait before making a new request.

#### Examples

Retry-After: 2019-08-24T22:57:49.000 (date)

Retry-After: 120 (seconds)

## 3.5 Error Handling

### 3.5.1 Synchronous Errors

The goal of error responses is to create a source of information to not only inform the user of a problem, but the possible solution to that problem as well. RFC 7807 provides a standard format for returning problem details from HTTPS APIs, see [RFC7807](#). Whilst we will not follow this to the letter, it does provide some good pointers.

Wrapping an error in an error object gives consumers an easy way to check for an error by simply checking for the existence of the error object. Market Participants should adhere to the format as defined in section 4.5 when sending synchronous error messages to CSS.

### 3.5.2 Asynchronous Errors

A market participant asynchronous error is where an error occurs in your system as part of your asynchronous processing, after accepting a message from the CSS.

The end point to post the error information to is defined in section 5.3. The CSS will respond to the asynchronous error message using the response defined in section 5.2. These errors will go into the CSS error handling process.

A CSS asynchronous error is where an error occurs in the CSS as part of CSS asynchronous processing. In this scenario the CSS will inform the required market participants of the error, via the market participants Webhook, adhering to the format as defined in 4.54.4.10.

## 3.6 Validation

Validation of the Webhook payloads will be controlled via an Open API Specification supplied by CSS.

## 4 CSS Data Definitions

### 4.1 CSS Elements

The table below details the incoming and outgoing data elements that the CSS uses.

NM denotes that this field is not mastered by CSS; this document cannot provide any further definition.

| Element               | Datatype | Format   | Length  | Notes                                                                                                              |
|-----------------------|----------|----------|---------|--------------------------------------------------------------------------------------------------------------------|
| activeRegistrationId  | string   | UUID     | 36      | The current Active registration Id (UUID)                                                                          |
| addressSource         | string   | string   | 10      | How the address has been derived, see section 4.3.13                                                               |
| allianceId            | string   | UUID     | 36      | This id is provided by the Market Participant on creation of an alliance, this should be unique, preferably a UUID |
| allianceNominatorMpid | string   | string   | NM      | The MPID of the organisation that is proposing the alliance                                                        |
| allianceNomineeMpid   | string   | string   | NM      | The MPID of the organisation that will be in the alliance                                                          |
| allianceNominatorRole | string   | string   | NM      | The role of the organisation that is proposing the alliance                                                        |
| allianceNomineeRole   | string   | string   | NM      | The role of the organisation that will be in the alliance                                                          |
| allianceFromDate      | string   | datetime | See 4.2 | The date at which the alliance starts                                                                              |
| allianceToDate        | string   | datetime | See 4.2 | The date at which the alliance ended                                                                               |
| associationType       | string   | string   | NM      | Internal domain Type, see section 4.3.3                                                                            |
| changeOfOccupancyInd  | boolean  |          |         | true or false                                                                                                      |
| commsHubLinkDeviceId  | string   | EUI-64   | NM      | The Extended Unique Identifier of the Comms Hub Device                                                             |
| confirmationRequired* | boolean  |          |         | true or false                                                                                                      |
| contextType           | string   | string   | 50      | The context in which the Market Participant is receiving the message, e.g. LosingSupplier, see section 4.3.11      |
| correlationId         | string   | UUID     | 36      | The internal CSS reference used to group and track all related                                                     |

|                              |         |          |         |                                                                                                                                                                                               |
|------------------------------|---------|----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              |         |          |         | events for a given action (for a Switch Request for example) UUID                                                                                                                             |
| dccServiceInd                | boolean |          |         | true or false                                                                                                                                                                                 |
| domesticPremisesInd          | boolean |          |         | true or false                                                                                                                                                                                 |
| erroneousSwitchResolutionInd | boolean |          |         | true or false                                                                                                                                                                                 |
| errorCode                    | string  | string   | 10      | An internal error code mastered in CSS                                                                                                                                                        |
| errorDescription             | string  | string   | 5000    | An optional description of the error                                                                                                                                                          |
| errorTitle                   | string  | string   | 255     | A short title of the error                                                                                                                                                                    |
| errorType                    | string  | string   | 2048    | An optional URL document giving additional information about this error and possible fixes.                                                                                                   |
| eventDate                    | string  | datetime | See 4.2 | The date and time when the CSS recorded the submission of the inbound event OR the date and time when CSS generated the outbound event.                                                       |
| eventDescription             | string  | string   | 5000    | A description of the event the message is related to.                                                                                                                                         |
| eventId                      | string  | UUID     | 36      | A unique reference for the event. All outbound messages from CSS, i.e. synchronous responses to your API calls and all CSS messages sent via a webhook, will have a unique eventId generated. |
| eventSubscriptionId          | string  | UUID     | 36      | The unique id relating to the event types available for a Market Participant to subscribe to                                                                                                  |
| eventType                    | string  | string   | NM      | The type of event the message is related to, e.g. RegistrationEvent, see section 4.3.9                                                                                                        |
| fuelType                     | string  | string   | NM      | See section 4.3.1                                                                                                                                                                             |
| greenDealFromDate            | string  | datetime | See 4.2 | The date at which the green deal starts for the RMP or market participant                                                                                                                     |
| greenDealToDate              | string  | datetime | See 4.2 | The date at which the green deal ends for the                                                                                                                                                 |

|                                 |         |          |         |                                                                                        |
|---------------------------------|---------|----------|---------|----------------------------------------------------------------------------------------|
|                                 |         |          |         | RMP or market participant                                                              |
| interventionWindowStartDate     | string  | datetime | See 4.2 | The date at which the intervention window starts                                       |
| interventionType                | string  | string   | NM      | The type of intervention being requested see section 4.3.2                             |
| marketParticipantRoleEvent      | string  | string   | NM      | Type of event that can be recorded against a market participant role. See 4.3.14       |
| meteringPointEnergyFlow         | string  | string   | NM      | The direction of energy flow, into or out of the property. Electricity only, see 4.3.4 |
| meteringPointEnergyFlowFromDate | string  | datetime | See 4.2 | The date at which the change to the Energy Flow is considered to have commenced        |
| meteringPointMeteredInd         | boolean |          |         | true or false                                                                          |
| mpid                            | string  | string   | NM      | Market Participant Identifier                                                          |
| mpxn                            | string  | string   | NM      | MPAN or MPRN                                                                           |
| networkProvisionMpid            | string  | string   | NM      | The MPID of the organisation acting at the network provider                            |
| networkProvisionRole            | string  | string   | NM      | The role of the organisation acting at the network provider                            |
| networkProvisionFromDate        | string  | datetime | See 4.2 | When the organisation became the network provider                                      |
| pendingRegistrationId           | string  | UUID     | 36      | The new Pending registration Id initiated from a switch request (UUID)                 |
| registrationInitiator           | string  | string   | 30      | The context of the market participant who initiated the switch. See 4.3.12             |
| registrationId                  | string  | UUID     | 36      | UUID                                                                                   |
| registrationActiveDate          | string  | datetime | See 4.2 | The date the registration changes to Active                                            |
| registrationInactiveDate        | string  | datetime | See 4.2 | The date the registration changes to Inactive                                          |
| registrationPermissionFromDate  | string  | datetime | See 4.2 | The date from which the market participant is allowed to create registrations          |

|                                     |              |          |         |                                                                                                                                               |
|-------------------------------------|--------------|----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| registrationPermissionToDate        | string       | datetime | See 4.2 | The date at which the market participant is prevented from creating registrations                                                             |
| registrationStatus                  | string       | string   | NM      | See section 4.3.6                                                                                                                             |
| registrationStatusFromDate          | string       | datetime | See 4.2 | The date the registration status changes                                                                                                      |
| registrationRequestId               | string       | UUID     | 36      | UUID                                                                                                                                          |
| registrationRequestStatus           | string       | string   | NM      | See section 4.3.7                                                                                                                             |
| role                                | string       | string   | NM      | Market Participant Role                                                                                                                       |
| rmpStatus                           | string       | string   | NM      | See section 4.3.5                                                                                                                             |
| rmpStatusFromDate                   | string       | datetime | See 4.2 | The date and time that the RMP changed status                                                                                                 |
| shipperMpid                         | string       | string   | NM      | Shipper Market Participant Identifier                                                                                                         |
| shipperRole                         | string       | string   | NM      | Shipper Market Participant Role                                                                                                               |
| shipperFromDate                     | string       | datetime | See 4.2 | The date the registered shipper changed                                                                                                       |
| statusCode                          | number       |          | 3       | The http status code                                                                                                                          |
| supplierGeneratedReference          | string       | string   | NM      | A supplier generated reference for a switch or initial registration. This is NOT used internally by CSS but will be echoed back on responses. |
| supplierGeneratedOfafGroupReference | string       | string   | NM      | A supplier generated reference for an OFAF switch. This is NOT used internally by CSS but will be echoed back on responses.                   |
| supplierMpid                        | string       | string   | NM      | Supplier Market Participant Identifier                                                                                                        |
| supplierRole                        | string       | string   | NM      | Supplier Market Participant Role                                                                                                              |
| supplyStartDate                     | string       | datetime | See 4.2 | The date on which the Supplier is requesting to become the supplier of the RMP                                                                |
| timeBoundaryAlignmentStatus         | string       | string   | 30      | See section 4.3.17                                                                                                                            |
| updatedProperties                   | string array |          | [100]   | An array of properties that have changed in a payload. Denotes all properties which have changed on the payload object. For newly created     |

|         |        |        |    |                                   |
|---------|--------|--------|----|-----------------------------------|
|         |        |        |    | objects this array will be empty. |
| uprn    | number |        | 12 | Unique Property Reference Number  |
| version | string | string | 30 | The version of the API being used |

*\*effective from June 2024 under R0044 MHHS*

#### 4.1.1 MPL Address Mapping

(Mappings taken from [MAP09 v1.7 - Standard Address Format and Guidance Notes for Address Maintenance](#))

Where the MPL address is referenced, the following lists the components of the payload and are sent out from CSS. The data is sent by CSS as an object in JSON, which is an unordered set of name/value pairs so may not come through in the order listed.

| Field                   | Type   | MAP09 Defined Element           | Gas file format           | Description                                                                            |
|-------------------------|--------|---------------------------------|---------------------------|----------------------------------------------------------------------------------------|
| deliveryPointAlias      | string | Metering Point Address Line 1   | DELIVERY_POINT_ALIAS      | Free format, for example plot details or Organisation Name                             |
| subBuildingNameOrNumber | string | Metering Point Address Line 2   | SUB_BUILDING_NAME         | Sub building name as defined in PAF                                                    |
| buildingName            | string | Metering Point Address Line 3   | BUILDING_NAME             | Building name as defined in PAF                                                        |
| buildingNumber          | string |                                 | BUILDING_NUMBER           | Building number as defined in PAF                                                      |
| dependantThoroughfare   | string | Metering Point Address Line 4   | DEPENDANT_STREET          | Dependant thoroughfare descriptor and or dependant thoroughfare name as defined in PAF |
| thoroughfare            | string | Metering Point Address Line 5   | PRINCIPAL_STREET          | thoroughfare descriptor and or thoroughfare name as defined in PAF                     |
| doubleDependantLocality | string | Metering Point Address Line 6   | DOUBLE_DEPENDANT_LOCALITY | Double dependant locality as defined in PAF                                            |
| dependantLocality       | string | Metering Point Address Line 7   | DEPENDANT_LOCALITY        | Dependant locality as defined in PAF                                                   |
| postTown                | string | Metering Point Address Line 8   | POST_TOWN                 | post town as defined in PAF                                                            |
| county                  | string | Metering Point Address Line 9   | COUNTY                    | The county the postTown is located within                                              |
| postcode                | string | Metering Point Address Postcode | POSTCODE                  | postcode as defined in PAF which is a combination of in code and out code              |
| uprn                    | number | n/a                             | n/a                       | Unique Property Reference Number                                                       |

#### 4.1.1.1 *MPL Address Payload*

```
{  
  "deliveryPointAlias": "string",  
  "subBuildingNameOrNumber": "string",  
  "buildingName": "string",  
  "buildingNumber": "string",  
  "dependantThoroughfare": "string",  
  "thoroughfare": "string",  
  "doubleDependantLocality": "string",  
  "dependantLocality": "string",  
  "postTown": "string",  
  "county": "string",  
  "postcode": "string",  
  "uprn": number  
}
```

## 4.1.2 REL Address Elements

| Field             | Type   | Length | Description                                                                                                                                                                                                                                    |
|-------------------|--------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| primaryName       | string | 90     | This is the Primary Addressable Object description. This is normally the name and or number of the property                                                                                                                                    |
| secondaryName     | string | 90     | This is the Secondary Addressable Object description, e.g. the “Flat 2” in the address “Flat 2, London House, Exeter”. This is only relevant for a child property. “London House” in this case will be the Primary Name of the parent property |
| street1           | string | 100    | LPI <sup>2</sup> - derived from Street<br>DPA <sup>3</sup> - the Thoroughfare                                                                                                                                                                  |
| street2           | string | 80     | LPI – Blank<br>DPA - dependant thoroughfare                                                                                                                                                                                                    |
| locality1         | string | 35     | LPI – derived from Street – Using locality code lookup<br>DPA – dependant locality                                                                                                                                                             |
| locality2         | string | 35     | LPI - Blank<br>DPA – double dependant locality                                                                                                                                                                                                 |
| town              | string | 30     | LPI – Derived from Street – Using Town code lookup<br>DPA – Post Town                                                                                                                                                                          |
| postcode          | string | 8      | Postcode associated with the address                                                                                                                                                                                                           |
| logicalStatus #   | number | 1      | This is the status of the address. See 4.3.16                                                                                                                                                                                                  |
| language #        | string | 3      | The language of the address (ISO 639-2 Code). For example, in Wales you will usually have an English and Welsh address. It will be cym for welsh.                                                                                              |
| organisation #    | string | 60     | Current organisation name of the property if one exists                                                                                                                                                                                        |
| addressType #     | string | 3      | The type of address of this entry in the array. See 4.3.15                                                                                                                                                                                     |
| confidenceScore # | number | 3      | A relative confidence score on the match from MPL to REL                                                                                                                                                                                       |
| classification #  | string | 6      | Classification code of the property as per the AddressBase Premium classification scheme                                                                                                                                                       |
| latitude #        | number | 10,6   | Latitude of the associated property, usually either the                                                                                                                                                                                        |

<sup>2</sup> See [British Standard 7666](#)

<sup>3</sup> The Delivery Point Address is derived from PAF (Postcode Address File) and identifies a property that receives deliveries from the Royal Mail

|             |        |      |                                                                                                                                                   |
|-------------|--------|------|---------------------------------------------------------------------------------------------------------------------------------------------------|
|             |        |      | centroid of the building polygon or a general internal point within the building polygon                                                          |
| Longitude # | number | 10,6 | Longitude of the associated property, usually either the centroid of the building polygon or a general internal point within the building polygon |

# Where addressSource is “MPL” or “Manual”, these Address Elements will be NULL and only a single address will be included in the payload.

Where the MPL address is referenced, the following lists the components of the payload and are sent out from CSS. The data is sent by CSS as an object in JSON, which is an unordered set of name/value pairs so may not come through in the order listed.

Note: The mappings contained in the table above are representative of the data mappings as they are contained within OSABP and not intended as presentation mappings.

## 4.2 CSS Field Data Types

| Field   | Format   | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| string  |          | Any printable characters.                                                                                                                                                                                                                                                                                                                                                                                   |

| number  |          | Numbers must be an integer or a floating point                                                                                                                                                                                                                                                                                                                                                              |

## 4.3 Enumerations

### 4.3.1 fuelType

| Value | Description |
|-------|-------------|
| G     | Gas         |
| E     | Electricity |

### 4.3.2 interventionType

| Value       | Description                             |
|-------------|-----------------------------------------|
| Objection   | Intervention being made is an Objection |
| NoObjection | There is no objection to the switch     |
| Annulment   | Intervention being made is an Annulment |
| Withdrawal  | Intervention being made is a Withdrawal |

### 4.3.3 associationType

| Value                | Description                                                     |
|----------------------|-----------------------------------------------------------------|
| relatedSecondaryMpxn | The association to the Primary MpxN is a related Secondary MPxN |

### 4.3.4 energyFlow

| Value | Description           |
|-------|-----------------------|
| I     | Energy Flow is Import |
| E     | Energy Flow is Export |

### 4.3.5 rmpStatus

| Value | Description               |
|-------|---------------------------|
| C     | RMP Status is Created     |
| O     | RMP Status is Operational |
| T     | RMP Status is Terminated  |
| D     | RMP Status is Dormant     |

### 4.3.6 registrationStatus

| Value           | Description                             |
|-----------------|-----------------------------------------|
| Pending         | Registration Status is Pending          |
| Active          | Registration Status is Active           |
| Confirmed       | Registration Status is Confirmed        |
| Inactive        | Registration Status is Inactive         |
| Cancelled       | Registration Status is Cancelled        |
| SecuredActive   | Registration Status is Secured Active   |
| SecuredInactive | Registration Status is Secured Inactive |

### 4.3.7 registrationRequestStatus

| Value       | Description                              |
|-------------|------------------------------------------|
| Submitted * | Registration Request Status is Submitted |
| Validated   | Registration Request Status is Validated |
| Rejected    | Registration Request Status is Rejected  |

\* Whilst a logical state of 'submitted' exists for this item it will never be communicated to market participants.

## 4.3.8 switchEventType

| Value                       | Description                                      |
|-----------------------------|--------------------------------------------------|
| switchTriggered             | Anticipated loss due to a switch being triggered |
| switchCancelled             | Anticipated loss of a switch cancelled           |
| registrationChangeOfShipper | Anticipated loss due to a shipper change         |

## 4.3.9 eventType

| CSS Event Type                           | Description                                                                                                                       | Covers ABACUS Message                                                        |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| RegistrationValidationNotification       | This notification message is sent as a result of an initial registration, change to a registration or a new switch                | RECM_SN_CSS02380                                                             |
| RegistrationPendingNotification          | This notification message is sent as a result of an initial registration or a new switch                                          | RECM_SN_CSS02300                                                             |

#### 4.3.12 registrationInitiator

| Value           | Description                                    |
|-----------------|------------------------------------------------|
| GRDA            | Registration Initiated by GRDA                 |
| GainingSupplier | Registration Initiated by the Gaining Supplier |

#### 4.3.13 addressSource

| Value  | Description                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MPL    | The MPL address was not matched in the addressing service as a standard address, so one was created using the information of the MPL                                                 |
| Manual | Subsequent to the REL address being created, it has been discovered that the address was wrong and has been manually assigned by a human to an address within the addressing service |
| Match  | The address is derived from a direct match with MPL provided to an address in the addressing service                                                                                 |

#### 4.3.14 marketParticipantRoleEvent

| Value                  | Description                                                  |
|------------------------|--------------------------------------------------------------|
| greenDeal              | Green Deal qualified                                         |
| registrationPermission | The market participant is able to register an RMP in the CSS |

#### 4.3.15 addressType

| Value | Description                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LPI   | Land Property Identifier – The LPI is basically the address of the BLPU in a standard format that uniquely identifies the BLPU in relation to a street as defined and held in the National Street Gazetteer (NSG). |

|     |                                                                                                   |
|-----|---------------------------------------------------------------------------------------------------|
| DPA | A Delivery Point Address (DPA) is defined as a property that receives deliveries from Royal Mail. |
|-----|---------------------------------------------------------------------------------------------------|

#### 4.3.16 logicalStatus

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | N/A (for Delivery Point Address which does not have a logical status) |
| 1     | Approved                                                              |
| 3     | Alternative                                                           |
| 6     | Provisional                                                           |
| 8     | Historic                                                              |

#### 4.3.17 timeBoundaryAlignmentStatus

| Value             | Description              |
|-------------------|--------------------------|
| Settlement Day    | Settlement is daily      |
| Settlement Period | Settlement is intraday   |
| Unaligned         | The alignment is unknown |

## 4.4 Element Mappings

### 4.4.1 RMP Gas/Electricity API

| ABACUS Field                                        | CSS Field                       |
|-----------------------------------------------------|---------------------------------|
| Supply Meter Point Reference Number                 | mpxn                            |
| MPAN Core                                           | mpxn                            |

| Market Participant Role Alliance Effective From Date    | allianceFromDate      |
| Market Participant Role Alliance Effective Through Date | allianceToDate        |

#### 4.5 Errors Payload

The errors data payload will be sent out to Market Participants as a result of errors within the CSS and also for receiving errors into CSS via the errors API. The http status code for a synchronous response will be the same as the statusCode property within the error object as defined below. Note: There could be multiple error objects in the "errors" element depending on the event in error.

```
{
  "errors": [ {
    "statusCode": 400,
    "errorCode": "V1200",
    "errorTitle": "The switch request is invalid",
    "errorDescription": "Property x is invalid, max length is 30 chars", (optional)
    "errorType": "https://cssProblems.net/errorCode/V1200" (optional)
  }
  ]
}
```

To accommodate OFAF switch requests, where more than a single mpxn is involved, CSS will return errors in an array against each mpxn and indicate this using a single error payload at the end of the array.

```
"data": [
  {
    "registrationRequestId": "xxx",
    "registrationRequestStatus": "Rejected",
    "mpxn": "aaaaaaaaaaaa",
    "supplierGeneratedReference": "xxx",
    "supplierGeneratedOfafGroupReference": "xxx",
    "errors": [
      {
        "statusCode": 404,
        "errorCode": "1080",
        "errorTitle": "Pending Registration ID not known",
        "errorDescription": "An RMP with Mpxn 'aaaaaaaaaaaa' could not be found",
        "errorType": "https://devportal.centrawswitchingservice.co.uk/errorCodes#1080"
      },
      {
        "statusCode": 400,
        "errorCode": "1156",
        "errorTitle": "Supply Start Date falls within the objection window",
        "errorDescription": "The supply start date 2020-11-08T00:00:00.000+00:00 must be after the
objection window closure date of ",
        "errorType": "https://devportal.centrawswitchingservice.co.uk/errorCodes#1156"
      }
    ]
  },
  {
    "registrationRequestId": "xxx",
    "registrationRequestStatus": "Rejected",
    "mpxn": "xxxxxxxxxx",
    "supplierGeneratedReference": "xxx",
    "supplierGeneratedOfafGroupReference": "xxx",
    "errors": [
      {
```

```

    "statusCode": 404,
    "errorCode": "1080",
    "errorTitle": "Pending Registration ID not known",
    "errorDescription": "An RMP with Mpxn 'xxxxxxxxxx' could not be found",
    "errorType": "https://devportal.centrawswitchingservice.co.uk/errorCodes#1080"
  },
  {
    "statusCode": 400,
    "errorCode": "1156",
    "errorTitle": "Supply Start Date falls within the objection window",
    "errorDescription": "The supply start date 2020-11-08T00:00:00.000+00:00 must be after the
objection window closure date of ",
    "errorType": "https://devportal.centrawswitchingservice.co.uk/errorCodes#1156"
  }
]
},
{
  "registrationRequestId": "xxx",
  "registrationRequestStatus": "Rejected",
  "mpxn": "yyyyyyyyyyyyyy",
  "supplierGeneratedReference": "xxx",
  "supplierGeneratedOfafGroupReference": "xxx",
  "errors": [
    {
      "statusCode": 404,
      "errorCode": "1080",
      "errorTitle": "Pending Registration ID not known",
      "errorDescription": "An RMP with Mpxn 'yyyyyyyyyyyyyy' could not be found",
      "errorType": "https://devportal.centrawswitchingservice.co.uk/errorCodes#1080"
    },
    {
      "statusCode": 400,
      "errorCode": "1156",
      "errorTitle": "Supply Start Date falls within the objection window",
      "errorDescription": "The supply start date 2020-11-08T00:00:00.000+00:00 must be after the
objection window closure date of ",
      "errorType": "https://devportal.centrawswitchingservice.co.uk/errorCodes#1156"
    }
  ]
}
],
"errors": [
  {
    "statusCode": 400,
    "errorCode": "1154",
    "errorTitle": "OFAF switch failed",
    "errorDescription": "3 of 3 registrations in the OFAF group failed validation",
    "errorType": "https://devportal.centrawswitchingservice.co.uk/errorCodes#1154"
  }
]

```

For non-OFAF switch requests (which contain a single request) any errors will be returned in the outer error block.

## 5 CSS API specification

### 5.1 General Principles

In the sections below, where the field is mandatory in the body, the item is bold and commented with \*.

All data passed to CSS should already have had any padding removed.

#### 5.1.1 POST

Use POST when you want to create a new resource or initiate a process.

#### 5.1.2 PATCH

Use PATCH when you want to update a subset of a resource.

When sending a PATCH, the fields you wish to "Update" should be sent in the "data" element. You only need to add the properties in the data element that you wish to update, you do not need to send the whole entity. Some properties in the data element may have a dependency on your Role within the CSS.

If a data item is not supplied, it will not be updated.

**data:**

```
{
    "item1": "item1value"
}
```

If an object in the system looks like the example above:

- Item 1 is an item that just has a value
  - To set item1 to not have a value, send "item1": null
  - To update item1 to have a new value send "item1": "new value"

Use PATCH when you want to delete a resource on a /delete route.

#### 5.1.3 PUT

Use PUT when you need to replace a resource in its entirety.

Use of the PUT method essentially updates the given resource at the request URI. If the request URI refers to an already existing resource – an update operation will happen, otherwise a create operation should happen if the request URI is a valid resource URI.

### 5.1.4 CorrelationId and EventId

The correlationId will appear in HTTP headers, standard responses, and will also be sent out as part of the webhook payload for related messages.

In HTTP headers it will appear in the response field X-Correlation-Id

e.g. X-Correlation-Id: f058ebd6-02f7-4d3f-942e-904344e8cde5

The correlationId can be used by Market Participants to relate messages that are part of the same workflow.

The below is a depiction of how the correlationId and eventId would flow in an asynchronous scenario.

### 5.1.5 RegistrationId

The CSS will use registration identifiers (registrationId) to uniquely identify each registration. CSS will generate a new registrationId upon receipt of an initial registration or a switch request. All market participants who receive registration lifecycle events will receive the registrationId as part of the Registration Data Payload.

If the losing supplier wishes to object to the proposed switch, they will have to use the newly generated registrationId when intervening, see section 5.6.5. Other market participants will need to store the registrationId for future updates from the CSS and to update the CSS regarding a registration.

The below diagram depicts the basic flow of when and where the registrationId is generated and propagated. The adoption or creation of registrationIds when migrating data prior to go-live will be covered in the data migration document.

## 5.2 Standard Response Body

This is the standard response body sent out synchronously by CSS whenever a message is received by CSS. The errors property will only be populated if the request is in error.

### Body:

```
{
  "version": "string", --*
  "correlationId": "UUID", --*
  "eventId": "UUID", --*
  "eventDate": "string", --*
  "errors": [{Object see section 4.5}]
}
```

### 5.3 [Error API Request](#)

This is the request body expected by the CSS if there is an error to report after processing.

Available to: Any market participant known to CSS

**Route:** /errors

**Method:** POST

**Body:**

```
{
  "eventId": "string", --*
  "correlationId": "string", --*
  "errors": [{Object see section 4.5}]
}
```

Note: The eventId should be the eventId sent as response to the request which initiated the error.

**Response:**

**Status Codes:** 201, 400, 401, 403, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

## 5.4 Webhook API

This API is used to subscribe, unsubscribe and view the Webhooks associated with a Market Participant and each role they perform for each eventType available to them, see section 7.2. As the available event types are mastered by CSS, Market Participants will need to call the GET endpoint first to get the list of events they can subscribe to.

The general subscription flow will be

1. Call the POST endpoint to get the event types available for you to subscribe to
2. Call the POST endpoint to subscribe to **all** the mandatory events and any optional events
3. Use the PATCH and PUT endpoints to manage your subscriptions

You can use the same Webhook URL for all event subscriptions if you wish or have separate Webhook URLs for each event subscription.

On registering Webhook URLs, CSS will send WebhookVerificationEvent messages to those Webhook URLs to verify they are valid HTTPS endpoints, if a 202 is not returned for all those requests, or a request times out, the whole subscription will fail. You must then correct any errors and try to register again, until the verification succeeds. The verification body will follow the standard Webhook structure defined in section 6.

Outgoing messages from CSS will be POSTed to the Webhook URLs defined against each eventType you have subscribed to.

There is no need to send in your MPID when using this API as CSS will derive this information from your initial registration to CSS see section 3.4.3. CSS also holds information regarding the Roles associated with your MPID.

Available to: All Market Participants.

This endpoint provides all the event types available for a Market Participant to subscribe to and whether those events have been subscribed to or not.

**Route:** /system/webhook/mpid

**Method:** POST

**Responses:**

**Status Codes:** 200

**Body:**

```
{
  Standard Response Body,
  "data": [ {
    "eventSubscriptionId": "string", --*
    "mpid": "string", --*
    "role": "string", --*
    "eventType": "string", --*
    "mandatory": boolean, --*
    "webhookUrl": "string"
  } ]
}
```

**Status Codes:** 400, 401, 403, 429, 500, 503

**Body:**

```
{
```

### Standard Response Body

```
}
```

The POST endpoint is used to subscribe your webhook URLs against each eventType you wish to register for.

**Note:** Some event types are mandatory for certain roles, you must subscribe to all of these, failure to do so will result in an error response. You can get the list of event types available to you from the POST endpoint above.

**Route:** /system/webhook

**Method:** POST

**Body:**

```
{
  "eventSubscriptionId": "string", --*
  "webhookUrl": "string" --*
}
```

**Response:**

**Status Codes:** 201, 400, 401, 403, 429, 500, 503

**Body:**

```
{
```

### Standard Response Body

```
}
```

This endpoint is used to unregister an event subscription.

**Route:** /system/webhook/{eventSubscriptionId}/delete

**Method:** PATCH

**Body:**

```
{
```

```
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
```

### Standard Response Body

```
}
```

Note: An error will be returned if an attempt is made to Delete a mandatory event subscription. Use the PUT below if you want to change the Webhook URL for an event subscription.

This endpoint is used to update a Webhook URL associated to an event subscription.

**Route:** /system/webhook/{eventSubscriptionId}

**Method:** PUT

**Body:**

```
{
  "webhookUrl": "string" --*
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

*This endpoint is used to confirm to CSS the outcome of processing any successfully received webhook message. Although the API definition supports any webhook message the initial implementation is limited to DCCSM confirmation of Supplier Arranged Appointment updates received via a RegistrationEventSynchronisation message . This endpoint will not become effective until June 2024 under R0044 MHHS*

Messages id:

RECM\_SN\_CSS06000

**Available:** DCCSM

**Route:** /system/webhook/message/confirmation

**Method:** POST

**Body:**

```
{
  "eventId": "string", --*
  "correlationId": "string", --*
  "errors": [{error object}]
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

## 5.5 RMP API Request

A request would be made to this API when creating a new RMP (POST) or updating information belonging to that RMP (PATCH).

Available to: GRDA, ERDA, DCC SM

Availability Notes:

- Only GRDA/ERDA can create (POST)
- GRDA/ERDA can update (PATCH) all fields bar commsHubLinkId
- DCC SM can only update (PATCH) the commsHubLinkId field

### 5.5.1 Gas

Abacus messages covered:

RECM\_SN\_CSS00100  
 RECM\_SN\_CSS01100  
 RECM\_SN\_CSS01200  
 RECM\_SN\_CSS01300  
 RECM\_SN\_CSS01400  
 RECM\_SN\_CSS01600

**Route:** /rmps/gas

**Method:** POST

**Body:**

```
{
  "mpxn": "string", --*
  "networkProvisionMpid": "string", --*
  "networkProvisionRole": "string", --*
  "networkProvisionFromDate": "string", --*
  "rmpStatus": "string", --*
  "rmpStatusFromDate": "string", --*
  "mplAddress": {MPLAddress}, -- *
  "timeBoundaryAlignmentStatus": "string",
  "dccServiceInd": boolean,
  "assetOwnershipMaps": [{
    "mpid": "string" -- *,
    "role": "string" --*
  }]
}
```

**Response:**

**Status Codes:** 202, 400, 401, 403, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

**Route:** /rmps/gas

**Method:** PATCH

**Body:**

```
{
```

```

"mpxn": "string", --*
"data": { --*
  "networkProvisionMpld": "string",
  "networkProvisionRole": "string",
  "networkProvisionFromDate": "string",
  "rmpStatus": "string",
  "rmpStatusFromDate": "string",
  "mplAddress": {MPLAddress},
  "commsHubLinkDeviceId": "string",
  "timeBoundaryAlignmentStatus": "string",
  "dccServiceInd": boolean
}
}

```

**Response:****Status Codes:** 202, 400, 401, 403, 404, 429, 500, 503**Body:**

```

{
  Standard Response Body
}

```

### 5.5.2 Electricity

Abacus messages covered:

RECM\_SN\_CSS00100  
 RECM\_SN\_CSS00300  
 RECM\_SN\_CSS00400  
 RECM\_SN\_CSS00600  
 RECM\_SN\_CSS00700  
 RECM\_SN\_CSS01000

**Route:** /rmeps/electricity

**Method:** POST

**Body:**

```
{
  "mpxn": "string", --*
  "networkProvisionMpid": "string", --*
  "networkProvisionRole": "string", --*
  "networkProvisionFromDate": "string", --*
  "meteringPointEnergyFlow": "string", --*
  "meteringPointEnergyFlowFromDate": "string", --*
  "meteringPointMeteredInd": boolean,
  "rmpStatus": "string", -- *
  "rmpStatusFromDate": "string", -- *
  "mplAddress": {MPLAddress}, -- *
  "timeBoundaryAlignmentStatus": "string",
  "dccServiceInd": boolean,
  "greenDealFromDate": "string",
  "greenDealToDate": "string",
  "assetOwnershipMaps: [{
    "mpid": "string", -- *
    "role": "string" -- *
  }],
  "associations: [{
    "associationType": "string", -- *
    "associatedMpxn": "string" -- *
  }]
}
```

**Responses:**

**Status Codes:** 202, 400, 401, 403, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

**Route:** /rmeps/electricity

**Method:** PATCH

**Body:**

```
{
  "mpxn": "string", --*
  "data": {--*
```

```

        "dccServiceInd": boolean,
        "networkProvisionMpid": "string",
        "networkProvisionRole": "string",
        "networkProvisionFromDate": "string",
        "meteringPointEnergyFlow": "string",
        "meteringPointEnergyFlowFromDate": "string",
        "meteringPointMeteredInd": boolean,
        "greenDealFromDate": "string",
        "greenDealToDate": "string",
        "rmpStatus": "string",
        "rmpStatusFromDate": "string",
        "mplAddress": {MPLAddress},
        "commsHubLinkDeviceId": "string",
        "timeBoundaryAlignmentStatus": "string"
    }
}

```

**Response:****Status Codes:** 202, 400, 401, 403, 404, 429, 500, 503**Body:**

```

{
    Standard Response Body
}

```

### 5.5.3 Associations

These endpoints are used to update the associations for the RMP. It enables them to be managed as a separate entity if required. The CSS needs to be informed of all the current active Associations whenever they change. To clear the array of Associations completely, send an empty array on the request body i.e. "data": [].

Abacus messages covered:

RECM\_SN\_CSS00500

Available to: ERDA

**Route:** /rmpps/associations

**Method:** PATCH

**Body:**

```
{
  "mpxn": "string", --*
  "data": [{ --*
    "associationType": "string", -- *
    "associatedMpxn": "string" -- *
  }]
}
```

**Responses:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

#### 5.5.4 Asset Ownership MAP

These endpoints are used to update the asset ownership MAPs for the RMP. It enables them to be managed as a separate entity if required. The CSS needs to be informed of all the current active Asset Ownership MAPs whenever they change. To clear the array of Asset Ownership MAPs completely, send an empty array on the request body i.e. "data": []

Abacus messages covered:

RECM\_SN\_CSS00400

RECM\_SN\_CSS01200

Available to: GRDA, ERDA

**Route:** /rmpps/assetownershipmaps

**Method:** PATCH

**Body:**

```
{
  "mpxn": "string", --*
  "data": [{ --*
    "mpid": "string", -- *
    "role": "string" --*
  }]
}
```

**Responses:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

## 5.6 Registration API Request

This API will be used to add (POST) initial registrations and (PATCH) updates to existing registrations.

### 5.6.1 Initial registration

Abacus messages covered:

RECM\_SN\_CSS01700

RECM\_SN\_CSS01750

Available to: Energy Suppliers, GRDA

**Route:** /registrations

**Method:** POST

**Body:**

```
{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "supplierMpid": "string", --*
  "supplierRole": "string", --*
  "supplyStartDate": "string", --*
  "domesticPremisesInd": boolean, --*
  "supplierGeneratedReference": "string",
  "shipperMpid": "string", -**
  "shipperRole": "string" --**
}
```

\*\* required for Gas

**Response:**

**Status Codes:** 202, 400, 401, 403, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

### 5.6.2 Update Current Active Registration

Provide any of the properties in the "data" object below that you wish to be updated, some properties may be dependent on your Role within the CSS.

Abacus messages covered:

RECM\_SN\_CSS02000

Available to: Energy Suppliers

Availability Notes:

All Energy Suppliers can update (PATCH) the domesticPremisesInd property.

Only Gas Energy Suppliers can update (PATCH) the shipperMpid, shipperRole and shipperFromDate property.

It is not possible to cancel an Update Current Active Registration request where a future dated change of shipper has been requested.

Future-dated shipper requests are actioned in shipperFromDate Datetime order, so shipperFromDate Datetimes must be used to sequence corrections.

For a correction that must be made on the same calendar day as an already-submitted request, add a minimum of 5 minutes to the time element of the shipperFromDate to ensure that the correction is queued, and therefore actioned, later than the original request.

**Route:** /registrations/{registrationId}

**Method:** PATCH

**Body:**

```
{
  "mpxn": "string", --*
  "data": {--*
    "shipperMpid": "string",
    "shipperRole": "string",
    "shipperFromDate": "string",
    "domesticPremisesInd": boolean
  }
}
```

**Response:**

**Status Codes:** 202, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

### 5.6.3 Supplier Arranged Appointments

These endpoints are used to update the supplier arranged appointments for the registration. It enables each appointment to be managed as a separate entity if required. The CSS needs to be informed of all the current active Supplier Arranged Appointments whenever they change. To clear the array of supplier arranged appointments completely, send an empty array on the request body i.e. []

Abacus messages covered:  
RECM\_SN\_CSS00200

Available to: GRDA, ERDA

**Route:** /registrations/{registrationId}/supplierarrangedappointments

**Method:** PUT

**Body:**

```
{
  "mpid": "string", --*
  "role": "string", --*
  "fromDate": "string", --*
  "toDate": "string"
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

Query string parameters listed below are supported for this API.\*

| Parameter name       | Data Type | Usage                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| confirmationRequired | boolean   | <p><b>true</b> – API caller requests confirmation that the update to appointments have been applied successfully or not.</p> <p><b>false</b> – API caller does not expect a confirmation message for the update.</p> <p><b>omitted</b> – API caller does not expect a confirmation message for the update</p> |

The confirmationRequired parameter is optional. Usage is limited to:

- ERDA use the parameter to indicate whether a confirmation message is expected from DCCSM for a SAA update affecting MDR role appointments only.
- GRDA cannot use the above parameter.

*\*effective from June 2024 under R0044 MHHS*

#### 5.6.4 Switch API Request

A request is made to this API by an energy supplier when they wish to initiate a registration switch. To achieve a One Fail All Fail (OFAF) switch, all MPxN related properties involved in the OFAF need to be included in the registrations property array. All entries in the "registrations" property array are presumed to form an OFAF grouping. There is no way to inform the CSS of multiple switches using the registrations property array without creating an OFAF. To perform an individual MPxN switch simply provide one entry in the "registrations" property array.

Abacus messages covered:  
RECM\_SN\_CSS01800

Available to: Energy Suppliers

**Route:** /registrations/switch

**Method:** POST

**Body:**

```
{
  "supplyStartDate": "string", --*
  "supplierGeneratedOfafGroupReference": "string",
  "registrations": [{--*
    "mpxn": "string", --*
    "fuelType": "string", -- *
    "supplierMpid": "string", -- *
    "supplierRole": "string", --*
    "changeOfOccupancyInd": boolean, -- *
    "erroneousSwitchResolutionInd": boolean, -- *
    "domesticPremisesInd": boolean, -- *
    "shipperMpid": "string", -- **
    "shipperRole": "string", -- **
    "supplierGeneratedReference": "string"
  }]
}
```

\*\*mandatory for gas only

"registrations": Is a mandatory array of the registrations to switch, at least 1, if there are more than 1, then these will form an OFAF group with an auto generated group id generated by CSS.

**Response:**

**Status Codes:** 202, 400, 401, 403, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

### 5.6.5 Switch Intervention API Request

A request is made to this API when an energy supplier needs to object, annul or withdraw a switch.

Abacus messages covered:

RECM\_SN\_CSS02100

RECM\_SN\_CSS02200

Available to: Gaining Supplier, Losing Supplier,

Availability Notes:

- Losing Supplier can use interventionType of "Objection", "NoObjection" or "Annulment"
- Gaining Supplier can use interventionType of "Withdrawal"

**Route:** /registrations/{pendingRegistrationId}/switch/intervention

**Method:** POST

**Body:**

```
{
  "mpxn": "string", --*
  "interventionType": "string" --*
}
```

**Responses:**

**Status Codes:** 202, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

### 5.6.6 [Registration Deactivation API Request](#)

This request is made by energy suppliers to indicate that the registration is no longer active and is not being switched to another supplier.

Abacus messages covered:

RECM\_SN\_CSS01900

Available to: Energy Suppliers

**Route:** /registrations/{registrationId}/deactivation

**Method:** POST

**Body:**

```
{  
    "mpxn": "string" --*  
}
```

**Responses:**

**Status Codes:** 202, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{  
    Standard Response Body  
}
```

### 5.6.7 Registration Status Refresh API Request

Request a re-send of a registration status synchronisation message as appropriate to the market participant role provided.

The message delivered is a resend of the original message previously sent to the requesting party with the original message EventId value replaced with a newly created unique EventId value specific to the resend request. If multiple API calls are made to resend the same original message, each resent message will contain different EventId values. All other original message attributes are included and unchanged in a resent message.

The following registration status messages are supported:

- RegistrationSecuredActiveSynchronisation
- RegistrationSecuredInactiveSynchronisation
- RegistrationCancelledSynchronisation

If the optional correlationId is provided, the message returned will reflect the registration status as set in the context of the business process associated with the correlationId otherwise the message returned will reflect the current registration status within CSS.

Message Id:

RECM\_SN\_CSS06010

Available to: GRDA

**Route:** /registrations/{registrationId}/statusrefresh

**Method:** POST

**Body:**

```
{
  "mpxn": "string" --*,
  "role": "string" --*,
  "correlationId": "string"
}
```

**Responses:**

**Status Codes:** 202, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

### 5.6.8 Active Registration Refresh API Request

Request a registration synchronisation message (RegistrationEventSynchronisation) for the current active registration for a RMP as appropriate to the market participant role provided.

Message Id:

RECM\_SN\_CSS06020

Available to: GRDA

**Route:** /registrations/activererefresh

**Method:** POST

**Body:**

```
{
  "mpxn": "string" --*,
  "role": "string" --*
}
```

**Responses:**

**Status Codes:** 202, 400, 401, 403, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

## 5.7 Market Participant Data API

### 5.7.1 Market Role

Abacus messages covered:

RECM\_SN\_CSS05100

Available to:-RECDDG

**Route:** /domain/marketrole

**Method:** POST

**Body:**

```
{
  "role": "string", --*
  "description": "string", --*
}
```

**Response:**

**Status Codes:** 201, 400, 401, 403, 409, 429, 500, 503

**Body:**

```
{
  Standard Response Body,
}
```

**Route:** /domain/marketrole/{role}

**Method:** PATCH

**Body:**

```
{
  "description": "string", --*
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

**Route:** / domain/marketrole/{role}/delete

**Method:** PATCH

**Body:**

```
{
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

### 5.7.2 Market Participant Role

Abacus messages covered:

RECM\_SN\_CSS04200

RECM\_SN\_CSS05200

Available to: RECDDG

**Route:** /domain/marketparticipantrole

**Method:** POST

**Body:**

```
{
  "mpid": "string", --*
  "role": "string", --*
  "companyRegistrationNumber": "string" --*
  "ofafCompanyGroupId": "string",
  "greenDealFromDate": "string",
  "greenDealToDate": "string",
  "registrationPermissionFromDate": "string",
  "registrationPermissionToDate": "string"
}
```

**Response:**

**Status Codes:** 201, 400, 401, 403, 409, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

**Route:** /domain/marketparticipantrole/mpid/{mpid}/role/{role}

**Method:** PATCH

**Body:**

```
{
  "companyRegistrationNumber": "string",
  "ofafCompanyGroupId": "string",
  "greenDealFromDate": "string",
  "greenDealToDate": "string",
  "registrationPermissionFromDate": "string",
  "registrationPermissionToDate": "string"
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  Standard Response Body
}
```

**Route:** / domain/marketparticipantrole/mpid/{mpid}/role/{role}/delete

**Method:** PATCH

**Body:**

```
{
}
```

**Response:****Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503**Body:**

```
{
    Standard Response Body
}
```

**5.7.3 Alliance**

Abacus messages covered:

RECM\_SN\_ CSS00250

Available to: ERDA, GRDA

**Route:** /domain/alliance**Method:** POST**Body:**

```
{
    "allianceId": "string", --*
    "allianceNominatorMpid": "string", -- *
    "allianceNominatorRole": "string", -- *
    "allianceNomineeMpid": "string", -- *
    "allianceNomineeRole": "string", -- *
    "allianceFromDate": "string", --*
    "allianceToDate": "string"
}
```

**Response:****Status Codes:** 201, 400, 401, 403, 409, 429, 500, 503**Body:**

```
{
    Standard Response Body,
}
```

**Route:** /domain/alliance/{allianceId}**Method:** PATCH**Body:**

```
{
    "allianceFromDate": "string",
    "allianceToDate": "string",
}
```

**Response:****Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503**Body:**

```
{
    Standard Response Body
}
```

**Route:** /domain/alliance/{allianceId}/delete

**Method:** PATCH

**Body:**

```
{
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
    Standard Response Body
}
```

#### 5.7.4 Company

Abacus messages covered:

RECM\_SN\_CSS05000

Available to: RECDDG

**Route:** /domain/company

**Method:** POST

**Body:**

```
{
    "companyName": "string", --*
    "companyRegistrationNumber": "string", --*
    "companyRegistrationAuthority": "string" --*
}
```

**Response:**

**Status Codes:** 201, 400, 401, 403, 409, 429, 500, 503

**Body:**

```
{
    Standard Response Body
}
```

**Route:** /domain/company/companyRegistrationNumber/{companyRegistrationNumber}/  
companyRegistrationAuthority/{companyRegistrationAuthority}

**Method:** PATCH

**Body:**

```
{
    "companyName": "string",
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
    Standard Response Body
}
```

**Route:** /domain/company/companyRegistrationNumber/{companyRegistrationNumber}/  
companyRegistrationAuthority/{companyRegistrationAuthority}/delete

**Method:** PATCH

**Body:**

```
{  
}
```

**Response:**

**Status Codes:** 200, 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
```

[Standard Response Body](#)

```
}
```

## 6 CSS Webhook Payload Specification

All messages sent from CSS will follow the format detailed below.

Market Participants should respond with 202 (Accepted) if they regard the message payload as valid, this validation may take place out of process, in which case a 202 (Accepted) would still be expected and any errors found later after processing, can be posted to the error API see 5.3.

For any other errors the appropriate http status code should be returned along with an "errors" property see section 4.5.

### 6.1 Payload Structure

**Method:** POST

**Body:**

```
{
  "version": "string",
  "eventId": "string",
  "eventType": "string",
  "eventStatus": "string",
  "eventDate": "string",
  "contextType": "string",
  "correlationId": "string",
  "eventDescription": "string",
  "confirmationRequired": "bool"*
  "updatedProperties": ["string"],
  "data": {
    --see data payload sections below
  },
  "errors": [{"object See section 4.5}]
}
```

**Responses:**

**Status Codes:** 202

**Body:** n/a

**Status Codes:** 400, 401, 403, 404, 429, 500, 503

**Body:**

```
{
  "errors": [{"object See section 4.5}]
}
```

\*"confirmationRequired" is an optional property coming into effect in June 2024 under R0044 MHHS

#### 6.1.1 Static Properties

Each event payload sent from CSS to Market Participant's webhooks will have static properties in the body relating to the event. Refer to section 7.2 for the mapping of the logical messages to the webhook eventType.

```
{
  "version": "1.0",
  "eventId": "ba5861ff-eddc-4cb7-a9bd-5a22c3b8912d",
  "eventType": "RegistrationPendingSynchronisation",
  "eventStatus": "Ok",
```

```

    "eventDate": "2019-08-07T22:57:49.000Z",
    "contextType": " ECOES",
    "correlationId": " ba5861ff-eddc-4cb7-a9bd-5a22c3b8912d",
    "eventDescription": "Registration status changed to Pending",
    "updatedProperties": ["registrationStatus", " registrationStatusFromDate"],
    "data": {
      "registrationStatus": "Pending",
      "registrationStatusFromDate": "2019-08-07T15:00:00.000Z",
      ... omitted for brevity
    },
    "errors": see 4.5
  }

```

### 6.1.2 Error Object

If the CSS has generated errors during processing, then the payload will contain an errors property. In this case the eventStatus would be "Error". See 4.5

Only the 'Registration Validation Message' message type can carry an 'errors' property.

## 6.2 Data Payload by Context Type

In addition to the static properties there is a data element (unless it is an error). This dynamic "data" object relates to the "Action" which triggered this event. It will be the RMP data, or the data for a registration.

If a property in the data object is not present, then it is not set.

The following sections detail the data object that is expected for each type of message that is being sent out by CSS. Where the field is mandatory in the body, the item is bold and commented with \*.

The following webhook payloads are defined below by Context Type 4.3.11.

### 6.2.1 DCCSM

| Abacus Message Id                                                            | eventType                                                                                                                      |
|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|

| RECM_SN_CSS02950                                                             | RMPCreatedSynchronisation<br>RMPOperationalSynchronisation<br>RMPTerminatedSynchronisation<br>RMPDormantSynchronisation        |

**ContextType:** DCCSM

The data elements and their associated event types are listed below.

RegistrationEventSynchronisation

**Data:**

```
{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string", --*
  "supplierMpid": "string", --*
  "supplierRole": "string", --*
  "supplyStartDate": "string", --*
  "domesticPremisesInd": boolean, --*
  "supplierArrangedAppointments": [{
    "mpId": "string", --*
```

```

        "role": "string", --*
        "fromDate": "string",
        "toDate": "string"
    }}
}

```

NOTE: CSS will not include updated supplierArrangedAppointments details for registrations with a status of Inactive or Cancelled. This will apply as of June 2024 under R0044 MHHS

#### RegistrationSecuredActiveSynchronisation

##### Data:

```

{
    "mpxn": "string", --*
    "fuelType": "string", --*
    "registrationId": "string", --*
    "registrationStatus": "string", --*
    "registrationStatusFromDate": "string", --*
    "registrationActiveDate": "string", --*
    "supplierMpid": "string", --*
    "supplierRole": "string", --*
    "supplyStartDate": "string", --*
    "domesticPremisesInd": boolean --*
}

```

#### RegistrationSecuredInactiveSynchronisation

##### Data:

```

{
    "mpxn": "string", --*
    "fuelType": "string", --*
    "registrationId": "string", --*
    "registrationStatus": "string", --*
    "registrationStatusFromDate": "string", --*
    "registrationInactiveDate": "string" --*
}

```

#### RegistrationCancelledSynchronisation

##### Data:

```

{
    "mpxn": "string", --*
    "fuelType": "string", --*
    "registrationId": "string", --*
    "registrationStatus": "string", --*
    "registrationStatusFromDate": "string" --*
}

```

#### RMPEventSynchronisation

##### Data:

```

{
    "mpxn": "string", --*
    "fuelType": "string", --*
}

```

```

    "networkProvisionMpid": "string", --*
    "networkProvisionRole": "string", --*

    "meteringPointEnergyFlowFromDate": "string" --**
  }
  ** Electricity only

```

RMPCreatedSynchronisation  
 RMPOperationalSynchronisation  
 RMPTerminatedSynchronisation  
 RMPDormantSynchronisation

**Data:**

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "rmpStatus": "string", --*
  "rmpStatusFromDate": "string" --*
}

```

## 6.2.2 MAP

| Abacus Message Id | eventType                               |
|-------------------|-----------------------------------------|
| RECM_SN_CSS02340  | RegistrationSecuredActiveNotification   |
| RECM_SN_CSS02370  | RegistrationSecuredInactiveNotification |

**ContextType:** MAP

The data elements and their associated event types are listed below.

RegistrationSecuredActiveNotification

**Data:**

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string", --*
  "supplierMpid": "string", --*
  "supplierRole": "string", --*
  "registrationActiveDate": "string" --*
}

```

RegistrationSecuredInactiveNotification

**Data:**

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
}

```

```

    "registrationId": "string", --*
    "registrationStatus": "string", --*
    "registrationStatusFromDate": "string", --*
    "registrationInactiveDate": "string" --*
  }

```

### 6.2.3 MEM

| Abacus Message Id | eventType                                 |
|-------------------|-------------------------------------------|
| RECM_SN_CSS02370  | RegistrationSecuredInactiveNotification   |
| RECM_SN_CSS02390  | RegistrationChangeAnticipatedNotification |

#### ContextType: MEM

The data elements and their associated event types are listed below.

##### RegistrationSecuredInactiveNotification

###### Data:

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string", --*
  "registrationInactiveDate": "string" --*
}

```

##### RegistrationChangeAnticipatedNotification

###### Data:

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "anticipatedInactiveFromDate": "string", --*
  "switchEvent": "string" --*
}

```

#### 6.2.4 DES

Following the approval of CR-D036 on 23 October 2020, all webhooks to provide data to DES have been removed. No outbound messages will be sent and webhook registration is not required for the following event types.

DES will be updated via UK Link with CSS Switching data however this section is being retained in case a direct connection to CSS becomes preferred in the future.

| Abacus Message Id | eventType                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------|
| RECM_SN_CSS02500  | RegistrationPendingSynchronisation                                                                                             |
| RECM_SN_CSS02560  | RegistrationSecuredActiveSynchronisation<br>RegistrationSecuredInactiveSynchronisation<br>RegistrationCancelledSynchronisation |
| RECM_SN_CSS02550  | RegistrationEventSynchronisation                                                                                               |
| RECM_SN_CSS02600  | RetailEnergyLocationSynchronisation                                                                                            |

#### ContextType: DES

The data elements and their associated event types are listed below.

RegistrationPendingSynchronisation

RegistrationEventSynchronisation

#### Data:

```
{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string", --*
  "supplierMpid": "string", --*
  "supplierRole": "string", --*
  "shipperMpid": "string", --*
  "shipperRole": "string", --*
  "shipperFromDate": "string", --*
  "supplyStartDate": "string", --*
  "domesticPremisesInd": boolean --*
}
```

RegistrationSecuredActiveSynchronisation

#### Data:

```
{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string", --*
  "registrationActiveDate": "string", --*
  "supplierMpid": "string", --*
```

```

    "supplierRole": "string", --*
    "supplyStartDate": "string", --*
    "domesticPremisesInd": boolean, --*
    "shipperMpid": "string", --**
    "shipperRole": "string", --**
    "shipperFromDate": "string" --**
  }
  ** only populated for gas

```

#### RegistrationSecuredInactiveSynchronisation

##### Data:

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string", --*
  "registrationInactiveDate": "string" --*
}

```

#### RegistrationCancelledSynchronisation

##### Data:

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string" --*
}

```

#### RetailEnergyLocationSynchronisation

##### Data:

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "addressSource": "string", --*
  "uprn": number, --*
  "relAddress": [{ REL Address Payload - section 6.3 }] --*
}

```

### 6.2.5 ECOES

| Abacus Message Id | eventType                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------|
| RECM_SN_CSS02400  | RegistrationPendingSynchronisation                                                                                             |

| RECM_SN_CSS02600  | RetailEnergyLocationSynchronisation                                                                                            |
| RECM_SN_CSS07000  | SupplierArrangedAppointmentUpdateNotification*                                                                                 |

*\*effective from June 2024 under R0044 MHHS*

**ContextType:** ERDA

The data elements and their associated event types are listed below.

## RegistrationPendingSynchronisation

## RegistrationEventSynchronisation

**Data:**

```
{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string", --*
  "supplierMpid": "string", --*
  "supplierRole": "string", --*
  "supplyStartDate": "string", --*
  "domesticPremisesInd": boolean --*
}
```

## RegistrationSecuredActiveSynchronisation

**Data:**

```
{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string", --*
}
```

```

    "registrationActiveDate": "string", --*
    "supplierMpid": "string", --*
    "supplierRole": "string", --*
    "supplyStartDate": "string", --*
    "domesticPremisesInd": boolean --*
  }

```

#### RegistrationSecuredInactiveSynchronisation

##### Data:

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string", --*
  "registrationInactiveDate": "string" --*
}

```

#### RegistrationCancelledSynchronisation

##### Data:

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
  "registrationStatusFromDate": "string" --*
}

```

#### RetailEnergyLocationSynchronisation

##### Data:

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "addressSource": "string", --*
  "uprn": number, --*
  "relAddress": [{ REL Address Payload - section 6.3 }] --*
}

```

#### SupplierArrangedAppointmentUpdateNotification

##### Data:

```

{
  "confirmingMpid": "string", --*
  "registrationId": "string", --*
  "supplierArrangedAppointments": [{
    "mpid": "string", --*
    "role": "string", --*
    "fromDate": "string", --*
    "toDate": "string"
  }], --*
  "updateSucceeded": boolean --*
}

```

**NOTE: updateSucceeded**

Where 'FALSE', the Error Object of the webhook payload static properties will be populated with the associated errors.

Is not a required field until June 2024 under R0044 MHHS

## 6.2.8 HHDC, NHHDC

## 6.2.17 Registered Supplier

| Abacus Message Id | eventType                               |
|-------------------|-----------------------------------------|
| RECM_SN_CSS02380  | RegistrationValidationNotification      |
| RECM_SN_CSS02370  | RegistrationSecuredInactiveNotification |

**ContextType:** RegisteredSupplier

The data elements and their associated event types are listed below.

RegistrationValidationNotification

**Data:**

```

[ {
  "registrationRequestId": "string", --*
  "registrationRequestStatus": "string", --*
  "mpxn": "string", --*
  "errors": [{Object see section 4.5}] **
}]
** only populated if registrationRequestStatus is "Rejected"

```

RegistrationSecuredInactiveNotification

**Data:**

```

{
  "mpxn": "string", --*
  "fuelType": "string", --*
  "registrationId": "string", --*
  "registrationStatus": "string", --*
}

```

```
"registrationStatusFromDate": "string", --*  
"registrationInactiveDate": "string" --*  
}
```

### 6.3 REL Address Payload

Where address (REL) information is sent out, the following is what will be in the address payload:

```
{
  "secondaryName": "string",
  "primaryName": "string",
  "street1": "string",
  "street2": "string",
  "locality1": "string",
  "locality2": "string",
  "town": "string",
  "postcode": "string",
  "logicalStatus": number,
  "language": "string",
  "organisation": "string",
  "addressType": "string",
  "confidenceScore": number,
  "classification": "string",
  "latitude": number,
  "longitude": number
}
```

The REL address will be returned as an array. Where available one of these will be a delivery point address, this is denoted by the addressType field. See 4.1.2 for a description of the data elements. Where the MPL address is referenced, the above lists the components of the payload and are sent out from CSS. The data is sent by CSS as an object in JSON, which is an unordered set of name/value pairs so may not come through in the order listed.

## 7 Appendix

Messages ids with numeric component of 6000 or greater (RECM\_SN\_CSS06000 and above) are allocated post Abacus usage and are not therefore included in the tables below.

### 7.1 Abacus Inbound API Map to Sections

| Logical Message  | Logical Description                                      | Direction | Market Participant Role   | API section |
